14 DAYS

AI CHALLENGE

DAY 05

Topic:

Delta Lake Advanced

Challenge:

1. Implement incremental MERGE
2. Query historical versions
3. Optimize tables
4. Clean old files

#DatabricksWithIDC

1

Time Travel (Version History)

What it is:

Delta Lake keeps every change made to a table. You can go back in time and query old versions of data.

Why it matters:

- *Recover deleted/updated data*
- *Debug data issues*
- *Compare past vs current data*

Example (SQL):

```
-- View table history
DESCRIBE HISTORY sales_delta;

-- Query a specific version
SELECT * FROM sales_delta VERSION AS
OF 2;

-- Query by timestamp
SELECT * FROM sales_delta TIMESTAMP AS
OF '2024-01-10';
```

👉 Think of it like Ctrl + Z for data.

2

MERGE Operations (Upserts)

What it is:

MERGE allows you to INSERT, UPDATE, or DELETE data in one command.

Why it matters:

- *Used for incremental loads*
- *Avoids full table overwrite*
- *Very common in real-world pipelines*

Example:

```
MERGE INTO target_table t
USING source_table s
ON t.id = s.id
WHEN MATCHED THEN
  UPDATE SET *
WHEN NOT MATCHED THEN
  INSERT *
```

- 👉 *If record exists → UPDATE*
- 👉 *If record is new → INSERT*

3

OPTIMIZE & ZORDER

◆ OPTIMIZE

What it does:

- Combines many small files into bigger files
- Improves query performance

```
OPTIMIZE sales_delta;
```

◆ ZORDER

What it does:

- Physically organizes data based on frequently filtered columns

```
OPTIMIZE sales_delta  
ZORDER BY (customer_id);
```

👉 *Faster queries when filtering on customer_id.*

4

VACUUM (Cleanup Old Files)

What it is:

Deletes old, unused data files that Delta no longer needs.

Why it matters:

- Saves storage
- Keeps tables clean

```
VACUUM sales_delta RETAIN 168 HOURS;
```

- ⚠ *Default retention = 7 days (168 hours)*
- ⚠ *After VACUUM → old versions cannot be recovered*

Day 5 Key Takeaway

Delta Lake = Reliable Data Engineering

- ✓ *Version control for data*
- ✓ *Safe upserts*
- ✓ *High-performance queries*
- ✓ *Storage optimization*

On to Day 6
